

# Javascript

JavaScript was initially created to “make web pages alive”.

Scripts are provided and executed as plain text. They don't need special preparation or compilation to run.

```
<!DOCTYPE html>
<html>
<body>

<h2>JavaScript Statements</h2>

<p>A <b>JavaScript program</b> is a list of <b>statements</b> to be executed by a computer.</p>

<p id="demo"></p>

<script>
var x, y, z; // Declare 3 variables
x = 5;      // Assign the value 5 to x
y = 6;      // Assign the value 6 to y
z = x + y;  // Assign the sum of x and y to z

document.getElementById("demo").innerHTML =
"The value of z is " + z + ".";
</script>

</body>
</html>
```

# Javascript

## Javascript è un linguaggio debolmente tipizzato

<https://hacks.mozilla.org/2017/02/a-crash-course-in-just-in-time-jit-compilers/>

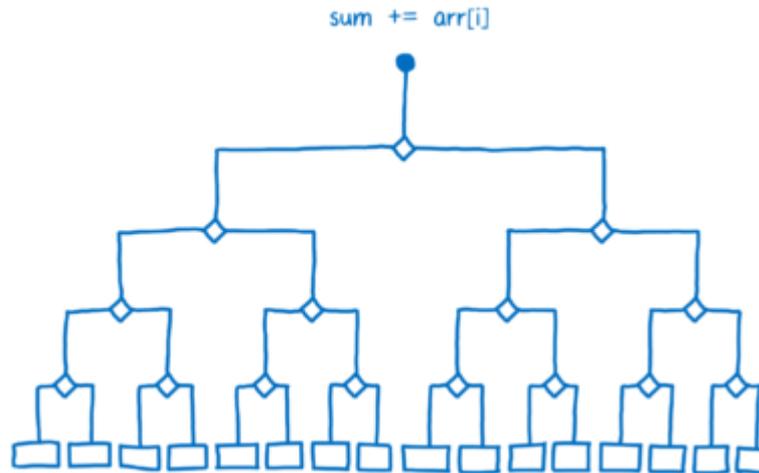

```
function arraySum(arr) {  
  var sum = 0;  
  for (var i = 0; i < arr.length; i++) {  
    sum += arr[i];  
  }  
}
```

is sum an int?

is arr an array?

is i an int?

is arr[i] an int?

# Javascript

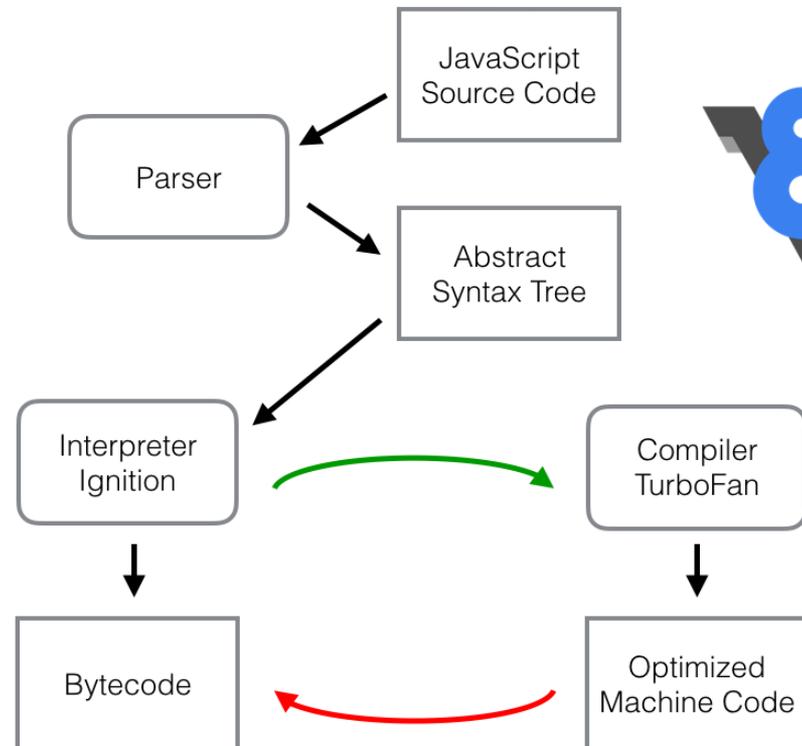

(SpiderMonkey)

(Nitro)

1. The engine (embedded if it's a browser) reads ("parses") the script.
2. Then it converts ("compiles") the script to the machine language.
3. And then the machine code runs, pretty fast.

# Javascript

Machine code

```
// x86_64 machine code  
movl rbx,[rax+0x1b]  
REX.W movq r10,0x100000000  
REX.W cmpq r10,rbx  
jnc 0x30d119104275 <+0x55>  
REX.W movq rdx,0x100000000  
call 0x30d118e843e0 (Abort)  
int3laddl rbx,0x1  
...
```

Bytecode

```
// V8 bytecode  
LdaSmi [1]  
Star r0  
LdaNamedProperty a0, [0], [4]  
Add r0, [6]
```

High Level Language

```
// JavaScript  
let result = 1 + obj.x;
```

Best for humans

Best for machines

@finkel

# Javascript

JavaScript is always synchronous and single-threaded. If you're executing a JavaScript block of code on a page then no other JavaScript on that page will currently be executed.

synchronous, single thread of control

synchronous, two threads of control

asynchronous

# Javascript – Callback and Promise

One approach to asynchronous programming is to make functions that perform a slow action take an extra argument, a *callback function*. The action is started, and when it finishes, the callback function is called with the result.

```
setTimeout(() => console.log("Tick"), 500);
```

A *promise* is an asynchronous action that may complete at some point and produce a value. It is able to notify anyone who is interested when its value is available.

```
let fifteen = Promise.resolve(15);  
fifteen.then(value => console.log(`Got ${value}`));
```

# Javascript – Callback and Promise

## Javascript Program

```
function baz(){  
  console.log('Hello from baz');  
}  
  
function bar() {  
  baz();  
}  
  
function foo() {  
  bar();  
}  
  
foo();
```

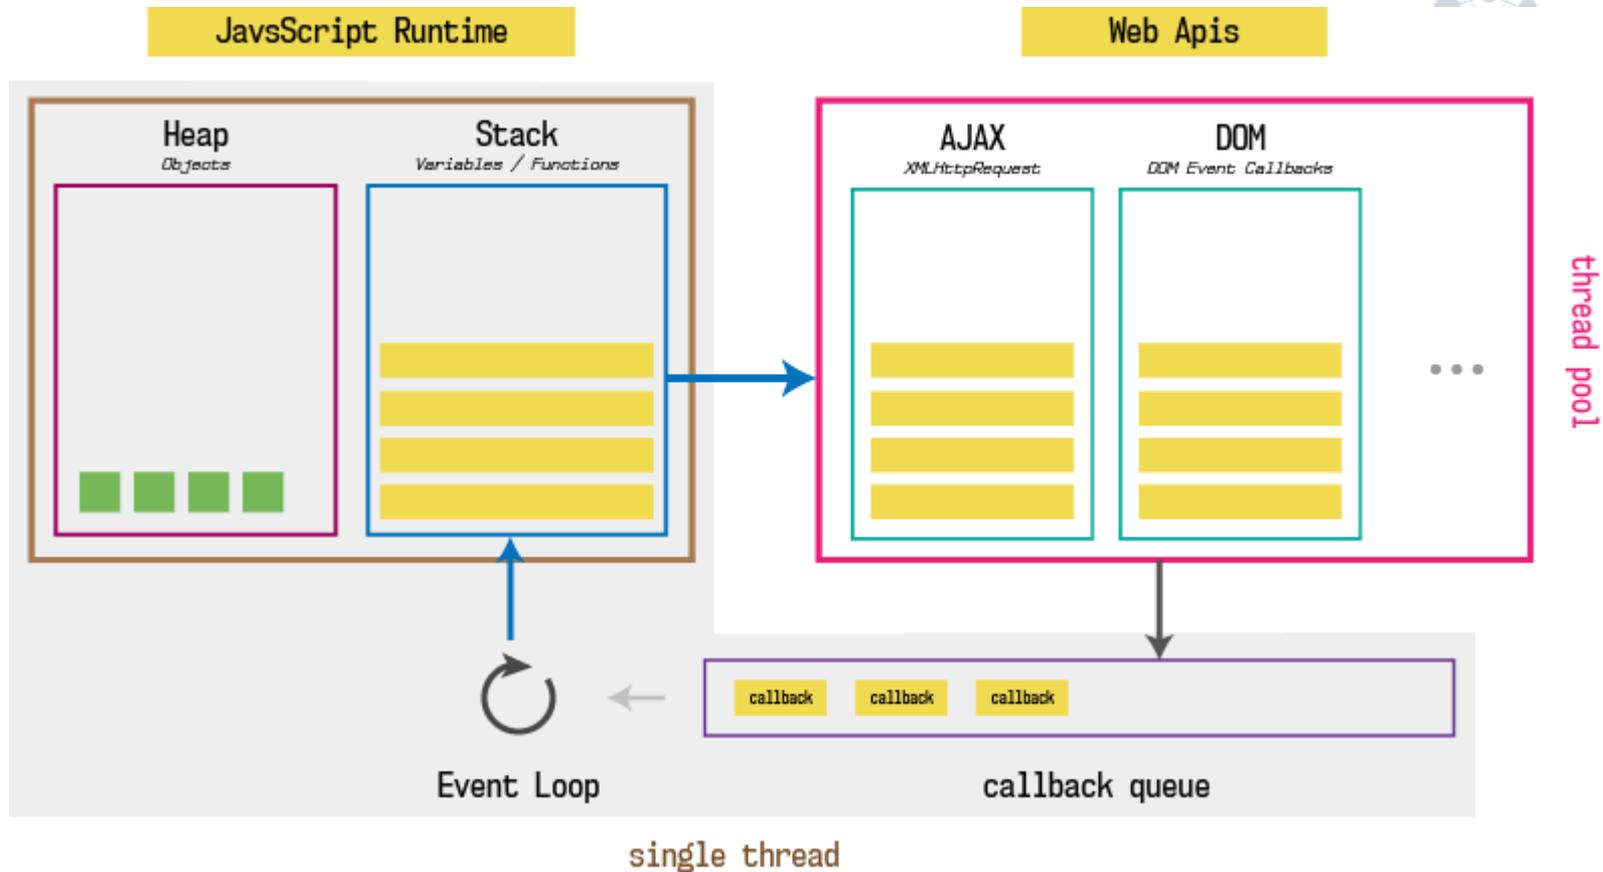

## Javascript Runtime

Heap  
*Objects*

Stack  
*Variables / Functions*

foo()

# Javascript – Callback and Promise

# Javascript – Callback and Promise

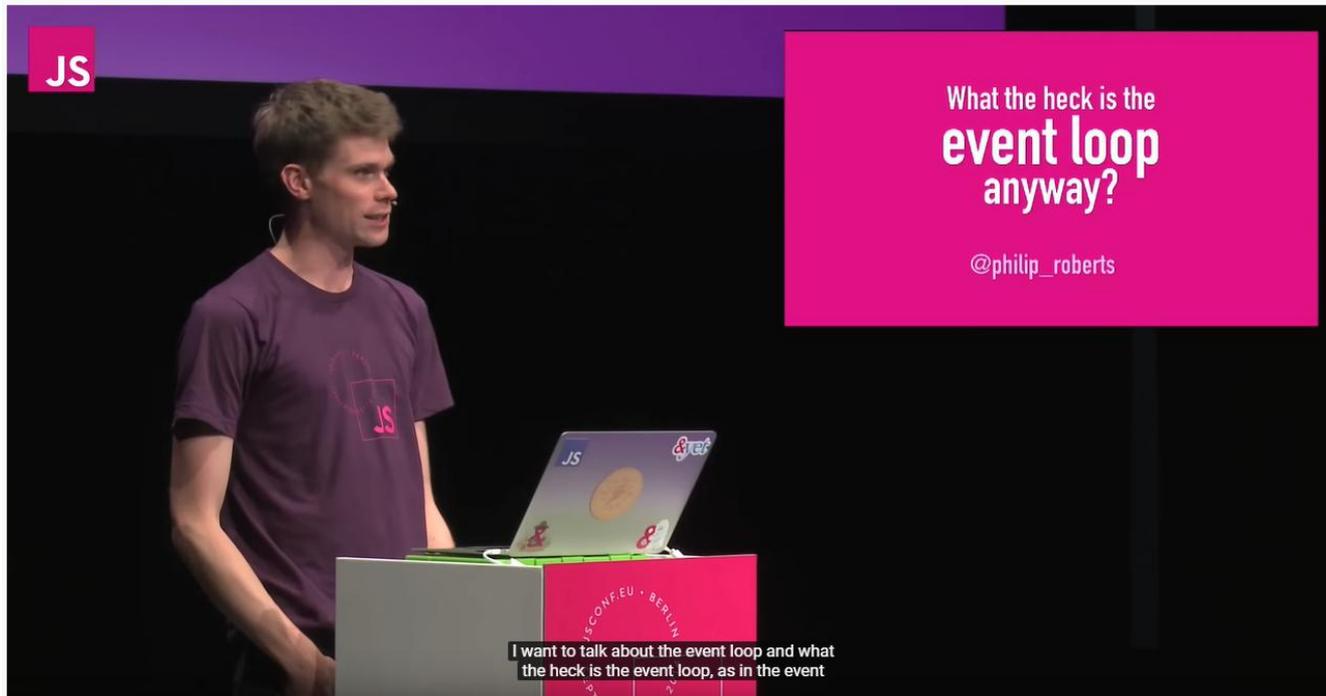

The screenshot shows the Loupe JavaScript debugger interface. On the left is a code editor with the following code:

```
1  
2  
3 function printHello() {  
4   console.log('Hello from baz');  
5 }  
6  
7 function baz() {  
8   setTimeout(printHello, 3000);  
9 }  
10  
11 function bar() {  
12   baz();  
13 }  
14  
15 function foo() {  
16   bar();  
17 }  
18  
19 foo();
```

Below the code editor is a button labeled "Click me!" and an "Edit" button. To the right of the code editor are three panels: "Call Stack", "Web APIs", and "Callback Queue". The "Call Stack" and "Web APIs" panels are currently empty. Below these two panels is a circular refresh icon. The "Callback Queue" panel is also empty and has a mouse cursor pointing to a small blue circle icon. The top of the interface has a header with the Loupe logo and a "help" link.

```
<body>
  <h1>Hello <span id="firstname"></span> <span id="lastname"></span>!</h1>
  <button onclick="reload_user();">Reload!</button>
  <p id="loadingtext">LOADING....</p>
</body>
```

```
</html>
```

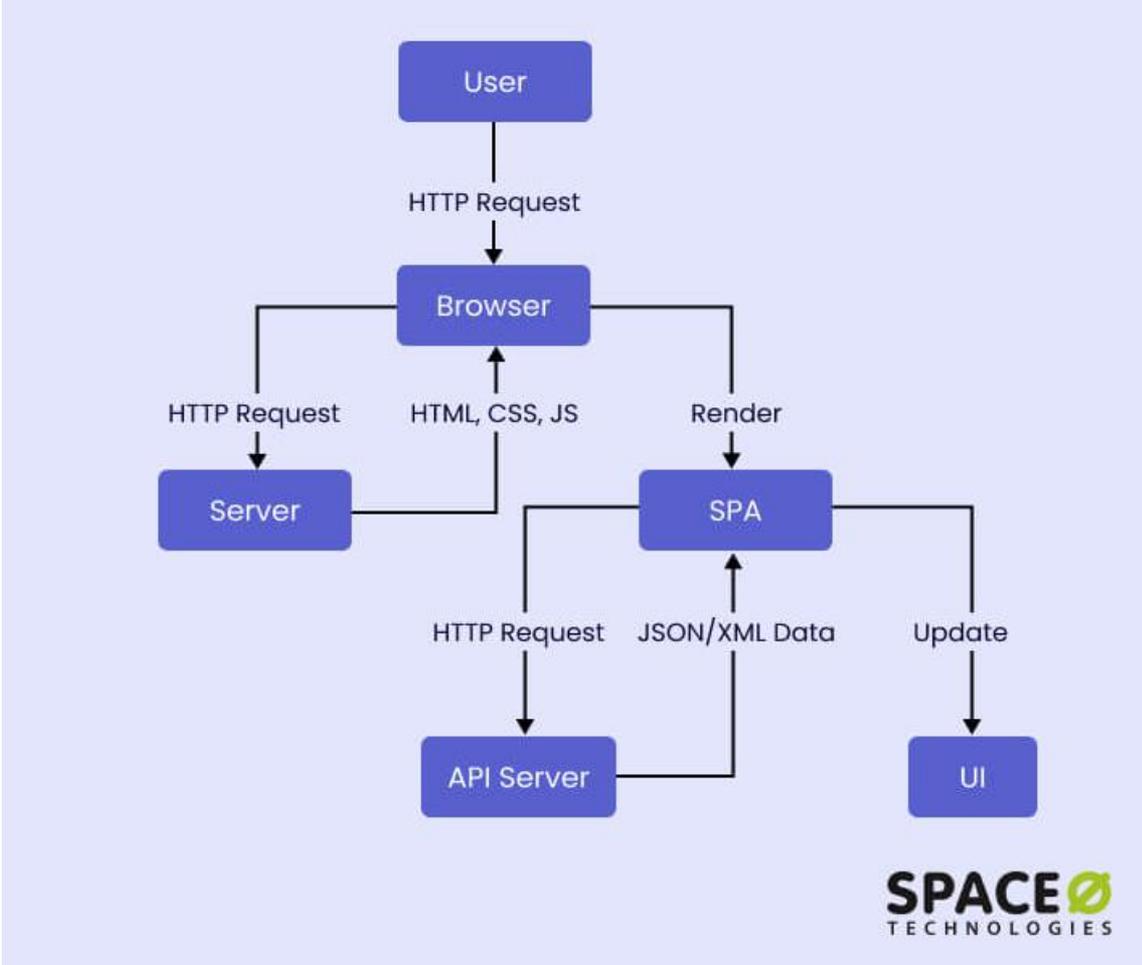

script.js

```
1 document.addEventListener("DOMContentLoaded", () => {
2   reload_user();
3 });
4
5 function reload_user(){
6   document.getElementById("loadingtext").style.display = 'block';
7
8   const xhttp = new XMLHttpRequest();
9   xhttp.onload = function() {
10    const result = JSON.parse(xhttp.responseText);
11    document.getElementById("firstname").innerHTML = result.results[0].name.
      first;
12    document.getElementById("lastname").innerHTML = result.results[0].name.
      last;
13    document.getElementById("loadingtext").style.display = 'none';
14  }
15  xhttp.open("GET", "https://randomuser.me/api");
16  xhttp.send();
17 }
```

Asynchronous Javascript And XML

# Flusso di una SPA

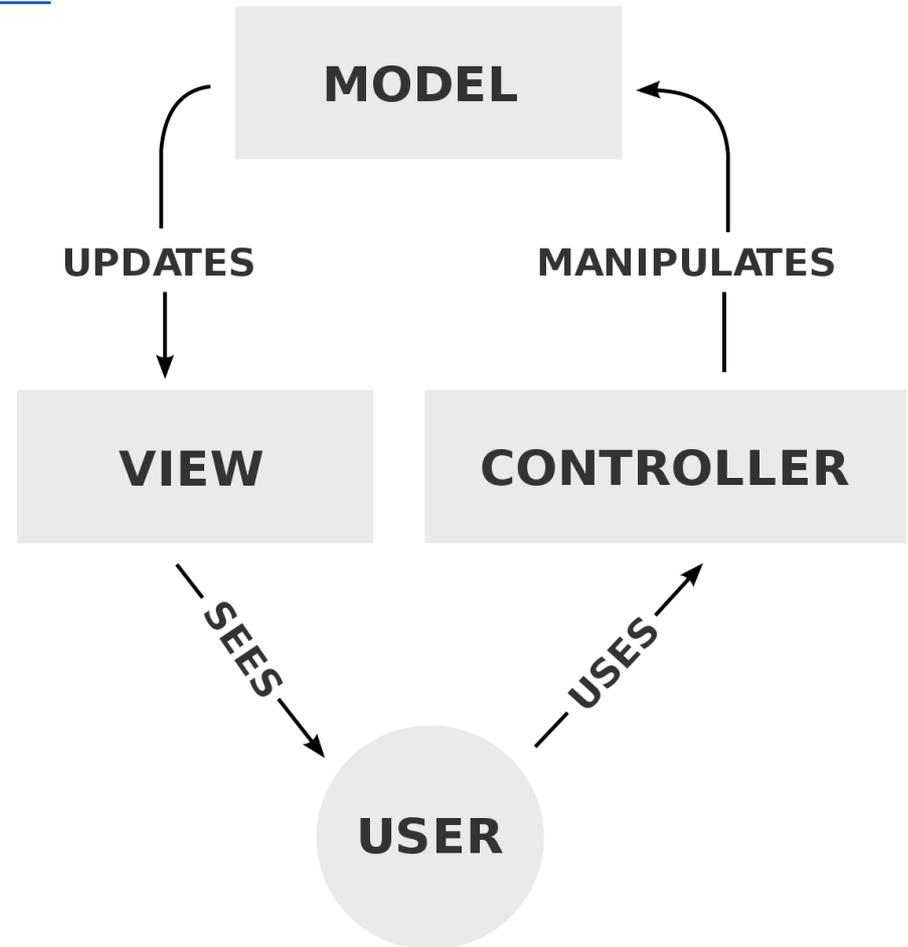

# Pattern MVC

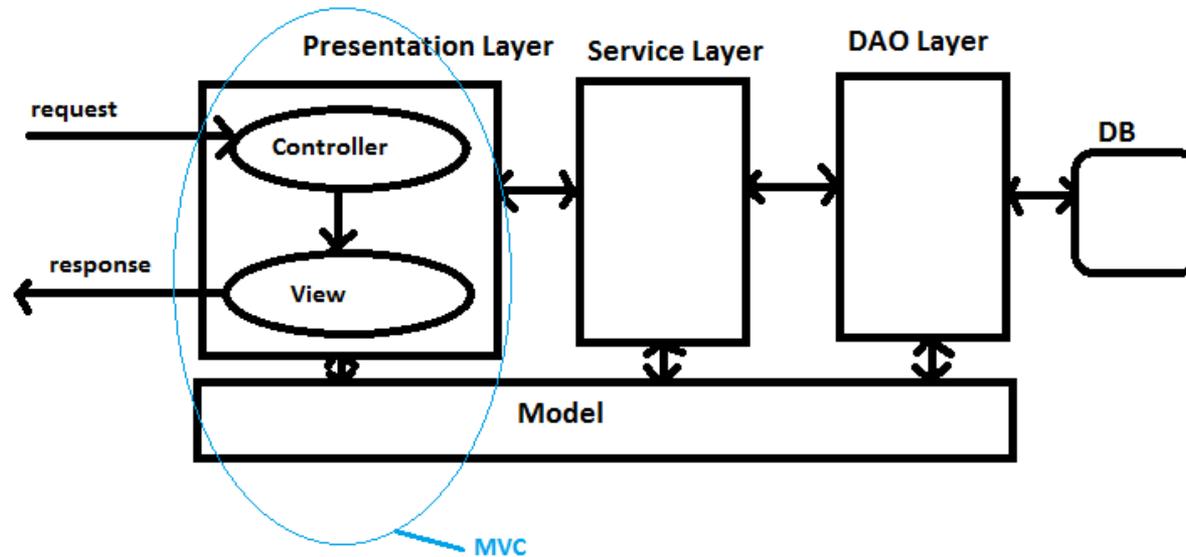

<https://it.wikipedia.org/wiki/Model-view-controller>

Vantaggi:

- 1) Disaccoppiare
- 2) Responsabilità certe
- 3) View multiple

# Architettura generica

The presentation layer is where the data is formatted and presented to the user.

The service layer is where the business logic of the application is implemented.

The persistence layer is where the data is simply saved or retrieved.

# Security

Malicious code on library

## Un buon inizio da leggere

If an attacker successfully injects any code at all, it's pretty much game over

XSS is too small scale, and really well protected against.

Chrome Extensions are too locked down.

Lucky for me, we live in an age where people install npm packages like they're popping pain killers.

I was excited at this point — I had a compelling package — but I didn't want to wait around while people slowly discovered it and spread the word. So I set about making PRs to existing packages that added my colourful package to their dependencies.

I've now made several hundred PRs (various user accounts, no, none of them as "David Gilbertson") to various frontend packages and their dependencies. "Hey, I've fixed issue x and also added some logging."

Look ma, I'm contributing to open source!

There are a *lot* of sensible people out there that tell me they don't want a new dependency, but that was to be expected, it's a numbers game.

## Un caso famoso

# Malicious code found in npm package event-stream downloaded 8 million times in the past 2.5 months

NOVEMBER 26, 2018 | IN [VULNERABILITIES](#) | BY DANNY GRANDER

A widely used npm package, `event-stream`, has been found to contain a malicious package named `flatmap-stream`. This was disclosed via a [GitHub issue](#) raised against the source repo.

<https://snyk.io/blog/malicious-code-found-in-npm-package-event-stream/>

`flatmap-stream` is a malicious package which was used in order to steal bitcoins from wallets. The malicious code was able to check if the `copydash` package was installed, and then attempt to steal the bitcoins stored in it. It was distributed by hijacking the popular `event-stream` package and adding `flatmap-stream` as a dependency.
